101-901-RE - Human Biology

Students will be introduced to the basic characteristics of life and how they apply to the human situation. After an introduction to the cell and its functions, the nervous and endocrine systems will be studied in terms of how they regulate the body's activities and maintain a constant internal state in a changing environment. The course will conclude with a brief introduction to the perpetuation of life through reproduction and genetic principles. This course will also include laboratory exercises that will provide an opportunity for students to better visualize aspects of the phenomenon of life.
